

PENILE ELONGATION & ENLARGEMENT

First and foremost, a patient should have realistic expectations about this procedure. He should be aware that this procedure will not produce dramatic changes in length and girth as most patients expect. Penile Elongation and Penile Enlargement (Girth) procedures result in about 1-2 cm increase in length and about 1-2 cm increase in girth.

PENILE ELONGATION (2,200 US\$):

The surgeon cuts the ligament which suspends the penis from the pubic bone. This releases some part of the penile shaft which is inside the body and allows the penis to hang out more. Results are more apparent in the flaccid state rather than in the erect state although the 1-2 cm increase in length may be noticeable in both the flaccid and erect state. Hardness of erection is not affected but the penis may not point upward as much as it did before the surgery.

PENILE ENLARGEMENT (2,000 US\$):

The surgeon utilizes groin tissue and inserts this into the penile shaft resulting in a thicker penile body.

DURATION: About 3 hours

- * After surgery, the patient will be taught stretching exercises to avoid scar tissue contracture and maintain results. These should be continued from 6-9 months following surgery.
- * Sex should be avoided for at least 1-2 months.
